Facial recognition tech added to video-laden doorbells to track "suspicious" people? Sounds like a thorny concept, as people are still reeling over privacy and the lack thereof in very recent times. "Face" it, facial recognition emotionally are words that are the current opposites of mom and apple pie. And now this: CNET reported that Amazon's Ring was taking heat in the corridors of opinion for even considering facial recognition for its video doorbells.

The application was revealed by the U.S. Patent and Trademark Office last month and reported by CNET along with other sites. Ben Fox Rubin in CNET reported that the video and audio-laden doorbell company called Ring (Amazon acquired Ring this year) filed a facial recognition [patent](#) application which drew criticism for considering ways of using Ring's products to spot suspicious people in a [neighborhood](#) and then alert law enforcement.

He quoted a statement from the ACLU that "Amazon is dreaming of a dangerous future." Concern is twofold, that such usage could invite a surveillance state seeking to target political activists and seeking to target those unfairly deemed as threats to the public.

The filing In November was an application to patent software for Ring video doorbells, according to reports, which include a motion-activated [video camera](#) and microphone and are connected to the Internet.

Jacob Snow, Technology & Civil Liberties Attorney, ACLU of Northern [California](#), wrote that this is a system that the police can use to match the faces of people walking by a doorbell camera with a photo database of persons deemed "suspicious." Homeowners can add photos of "suspicious" people into the system. The facial recognition program would scan anyone passing. If a match occurs, "the person's face can be automatically sent to law enforcement, and the police could arrive in minutes."

Snow also said, "It's time for Amazon to take responsibility and stop chasing profit at the expense of safety and civil rights."

Andy Meek in *BGR* walked readers through the idea discussed in the patent. "The patent application envisions using a [combination](#) of doorbell cameras and facial recognition technology to build a system that could be used to match images of people who show up at your door to a 'suspicious persons' database. The system would even pull up information about that person if it finds a match in the database." When the system gets a hit after database search, details could be sent to police.

"As a former patent litigator, I've spent a lot of time reading patents. It's rare for [patent applications](#) to lay out, in such [nightmarish](#) detail, the world a company wants to bring about," said Snow.

A report about the patent filing was also carried in *The Washington Post*, owned by Jeff Bezos. The reporter pointed out that "The company said both Ring and Amazon are in the habit of filing [forward-looking](#) patent applications that explore the possibilities of new technology. Noting that the patent has not been issued by the patent office, Amazon said patents do not necessarily reflect product development plans."

Meek also mentioned the Amazon Rekognition [facial recognition](#) system. Amazon defines Amazon Rekognition as "a [service](#) that makes it easy to add powerful visual analysis to your applications. Rekognition Image lets you easily build powerful applications to search, verify, and organize millions of images. Rekognition Video lets you extract motion-based context from stored or live stream videos and helps you analyze them."

Daily Mail said that in an emailed statement, "the firm said it has 'many useful applications in the real world', such as [locating](#) lost children at

amusement parks. It also noted that the company 'requires that customers comply with the law and be responsible when they use' its software products."
