

Seniors get special attention at consumer tech show

January 10 2020, by Julie Jammot

Smart pajamas from Japan-based startup Xenoma can be used to discreetly monitor the health vitals of seniors

How can the tech sector help seniors remain independent, connected, healthy, and safe?

Solutions for the elderly were prominently displayed at the 2020 Consumer Electronics Show ranging from [smart clothing](#) to embedded sensors to help monitor those at risk.

One of the keys for useful products, CES exhibitors said, is to have the [monitoring devices](#) as unobtrusive as possible so seniors feel less awkward. Here are three concepts for seniors seen at the gadget extravaganza this week:

Intelligent homes

Japanese homebuilding group Sekisui House showcased its new "Platform House Concept" which can allow seniors to live independently while being monitored for detection of disease or [health problems](#).

Developed with scientists from the Massachusetts Institute of Technology, the Sekisui House uses ceiling sensors to monitor a person's heartbeat; in the event of cardiac arrest, the home will call for help and unlock the doors after verification of emergency crews.

Brian Anthony, an MIT professor who spoke at the Sekisui exhibit, said the "home as a service" concept enables better [health](#) tracking of seniors even if they don't ask for help.

A person holds up the CarePredict app, which monitors seniors' daily activity and behavior patterns and alerts caregivers in case of changes that could indicate falls, malnutrition or depression at the 2020 Consumer Electronics Show

"One of biggest issues is compliance with medication, and wearing connected devices," Anthony said.

"Here you just have it in the environment, you don't have to worry about technology."

French startup Technis showed its smart flooring, which uses sensors to detect how seniors are moving, how often they use the bathroom and their pace of activity.

The system uses artificial intelligence to detect abnormalities and alert a person's medical team.

Smart (discreet) wearables

Sleepwear is a good way to track health vitals discreetly, according to Japanese startup Xenoma, which introduced its "e-skin" pajamas designed for [elderly people](#).

They look like normal pajamas but sensors analyze health vitals and sleep conditions, and detect falling.

The pajamas were one of several examples of textile computing, which relies on sensors woven into fabric to collect and analyze health data.

The Smardii connected diaper is seen on display at the 2020 Consumer Electronics Show in Las Vegas

Another wearable for seniors is a wrist-worn monitor from US startup CarePredict which can allow loved ones to track activities like eating, sleeping and walking before the vitals show signs of decline. An artificial intelligence program aims to predict problems including depression, according to the company,

CarePredict's Jerry Wilmink said the device is especially useful for people caring for elderly family members who live far away.

"The challenge is right now, that caregivers on average live about 3,000

miles away from seniors they care for, so they need eyeballs in that home," he said.

For the elderly with [medical conditions](#) requiring adult diapers, US startup Smardii offered its solution which monitors health by analyzing urine and stool.

"There are more and more elderly people and fewer people to take care of them," said co-founder Sebastien Gaddini of the Florida-based startup.

"We can help reduce costs in a nursing home setting."

The device, which can also track seniors who wander off, is expected to be launched this year in the US and later in Europe.

David Hojah (L), cofounder and CEO of Loro, shows the robot assistant for the wheelchair-bound at the 2020 Consumer Electronics Show

Robots and data

Robot companions for the elderly have been around for years. But the smart assistant designed as a parakeet from Boston startup Loro is aimed at wheelchair-bound users, offering an extra set of eyes and ears.

"It can see what's around without turning your head," said Loro co-founder David Hojah.

Loro is designed with artificial intelligence to recognize objects and, with the help of a connected tablet, can speak for the user if he or she cannot.

For some developers, collecting and analyzing data is a key for better wellness for seniors.

Ejenta, a California startup developing systems for remote health care, unveiled a system which can scoop up biometric data from a variety of sources such as smart clothing or phones, modeled after a program developed by NASA for astronauts.

Ejenta is using the system to monitor conditions for patients over age 85, enabling caregivers to have better information.

An attendee photographs a sign next to the CES logo ahead of the first keynote address at the 2020 Consumer Electronics Show in Las Vegas, Nevada

"This is where the future is going—all clothing and objects and sensors we wear will be connected, generating data," said Rachna Dhamija, co-founder and chief executive.

"So we need platforms like this which can collect it, analyze it and provide predictive analytics for your health."
