

European virus tracing apps highlight battle for privacy

May 4 2020, by Kelvin Chan

The race by governments to develop mobile tracing apps in order to contain infections after lockdowns ease is focusing attention on privacy. The debate is especially urgent in Europe, where academics and civil liberties activists are pushing for solutions that protect personal data. (Laurent Gillieron/Keystone via AP)

Goodbye lockdown, hello smartphone.

As governments race to develop mobile tracing apps to help contain infections, attention is turning to how officials will ensure users' privacy. The debate is especially urgent in Europe, which has been one of the hardest-hit regions in the world, with nearly 140,000 people killed by COVID-19.

The use of monitoring technology, however, may evoke bitter memories of massive surveillance by totalitarian authorities in much of the continent.

The European Union has in recent years led the way globally to protect people's [digital privacy](#), introducing strict laws for [tech companies](#) and web sites that collect personal information. Academics and civil liberties activists are now pushing for greater personal data protection in the new apps as well.

Here's a look at the issues.

WHY AN APP?

European authorities, under pressure to ease lockdown restrictions in place for months in some countries, want to make sure infections don't rise once confinements end. One method is to trace who infected people come into contact with and inform them of potential exposure so they can self-isolate. Traditional methods involving in-person interviews of patients are time consuming and labor intensive, so countries want an automated solution in the form of smartphone contact tracing apps. But there are fears that new tech tracking tools are a gateway to expanded surveillance.

EUROPEAN STANDARDS

Intrusive digital tools employed by Asian governments that successfully contained their virus outbreaks won't withstand scrutiny in Europe.

Residents of the EU cherish their [privacy rights](#) so compulsory apps, like South Korea's, which alerts authorities if users leave their home, or location tracking wristbands, like those used by Hong Kong, just won't fly.

The contact-tracing solution gaining the most attention involves using low energy Bluetooth signals on mobile phones to anonymously track users who come into extended contact with each other. Officials in western democracies say the apps must be voluntary.

RIVAL DESIGNS

The battle in Europe has centered on competing systems for Bluetooth apps. One German-led project, Pan-European Privacy-Preserving Proximity Tracing, or PEPP-PT, which received early backing from 130 researchers, involves data uploaded to a central server. However, some academics grew concerned about the project's risks and threw their support behind a competing Swiss-led project, Decentralized Privacy-Preserving Proximity Tracing, or DP3T.

Privacy advocates support a decentralized system because anonymous data is kept only on devices. Some governments are backing the centralized model because it could provide more data to aid decisionmaking, but nearly 600 scientists from more than two dozen countries have signed apnews.com/UnderstandingtheOutbreak
