

Cars rule as coronavirus shakes up travel trends in our cities

July 21 2020, by Neil G Sipe

As with other parts of the global economy, COVID-19 has led to rapid

changes in transport trends. The chart below shows overall trends for driving, walking and public transport for Australia as of July 17.

Unfortunately, the current lockdown of metropolitan Melbourne, which is at odds with trends in Australia's other biggest cities, is skewing the national average. These data, provided by [Apple Mobility Trends](#), are available for many cities, regions and countries around the world.

Updated daily, the data provide a measure of trends in [transport](#) use since early January 2020. The chart below summarises the changes since then in driving, walking and [public transport](#) for Brisbane, Sydney, Melbourne, Adelaide and Perth.

With the exception of Melbourne, driving has recovered and is now noticeably above pre-pandemic levels.

Public transport use is still well below baseline levels. It is recovering—again except for Melbourne—but slowly. The exception is Adelaide where public transport is only slightly below the baseline.

Walking is doing better than public transport. Adelaide, Brisbane and Perth are slightly above the baseline, while Sydney is slightly below it. Melbourne is still down by about a half.

How badly did lockdowns affect travel?

The chart below shows the largest declines in driving, walking and public transport were recorded in the period April 4-11. Most of the lowest values coincided with Easter holidays. However, regardless of the holiday, this was the period when levels of transport use were lowest.

The declines are fairly consistent across the cities. For driving, the declines were around 70%. For walking, the declines ranged from 65%

to 80%. Public transport recorded declines of 80-89%.

The recovery in driving is due, in part, to it being seen as having a lower risk of COVID-19 infection. People [see public transport as the least safe](#) because of the difficulties of social distancing on potentially crowded commutes.

Changes in driving, walking and public transport use

Percentage change in largest cities and nationally between January 13 2020 and July 17 2020

A study in early March by an MIT economist [amplified these fears](#) by associating public transport in New York City with higher rates of COVID-19 infection. Unfortunately, the research had some [significant flaws](#). Health experts have since indicated there is little evidence public transport has been the source of any COVID-19 infections.

Nevertheless, public transport agencies are in [serious financial trouble](#). In the US, experts are warning that, without large federal subsidies, public transport services are facing drastic cuts, which will impact where people live and work. Such shifts pose a [threat to the economic viability](#) of cities.

What is known about other transport modes? While comprehensive datasets are not available, evidence is emerging of the impacts on ride, bike and scooter sharing.

Ride sharing

As with all other transport modes, the pandemic has had big impacts on ride sharing. However some ride-sharing companies, like Uber, have diversified in recent years into areas such as food and freight delivery. These have provided much-needed [revenue](#) during the ride-sharing downturn.

[Market analysts are predicting](#) ride sharing will recover and continue to grow. This is due to need for personal mobility combined with [increasing urbanisation](#) and [falling car ownership](#).

Bike sharing

Globally, transport officials are predicting a long-term surge in bicycle use. Cycling appears to be booming at the expense of public transport.

Beijing's three largest bike share schemes reported a [150% increase](#) in use in May. In New York City, volumes [grew by 67%](#). Bike sales in the US almost [doubled in March](#).

In response, many cities are providing more cycling infrastructure, with cities like [Berlin and Bogota](#) leading the way with "pop-up" bike lanes. New Zealand has become the [first country](#) to fund so-called "tactical urbanism".

Greatest % change by travel mode in each city

(All the largest changes since January 13 were recorded in week of April 4 to April 11)

Melbourne has announced [12km of pop-up bike lanes](#) and is [fast-tracking an extra 40km](#) of bike lanes over the next two years. Sydney has added [10km of pop-up cycleways](#). Use of some Brisbane bikeways has [nearly doubled](#), leading to criticism of delays in providing pop-up lanes.

[London](#) intends to rapidly expand both cycling and walking infrastructure in anticipation of a ten-fold increase in bicycle use and a five-fold increase in pedestrians. This complements a [£250 million](#) (A\$448 million) UK government program to reallocate more space for cyclists.

Paris plans to add [50km of pop-up and permanent bikeways](#) in coming months. It's also [offering](#) a €500 (A\$818) subsidy to buy an electric bike and €50 to repair an existing bike.

Milan will add [35km of bikeways](#) as part of its Strade Aperte Plan. The Italian government is providing a [70% subsidy capped at €500](#) for people to buy a new bicycle.

We will have to wait to see whether all this interest translates into longer-term mode change.

E-scooters

E-scooter use has declined, as has the value of e-scooter companies. Lime, one of the larger companies, was valued at [US\\$2.4 billion \(A\\$3.4 billion\) last year but is down to US\\$510 million](#). Nevertheless, investor interest continues. Uber, Alphabet, GV and Bain and others put [\\$US170 into Lime](#) in May.

In Europe, ride-sharing company Bolt plans to expand its e-scooter and e-bike services to [45 cities in Europe and Africa](#) this year. Another positive sign for this mode is that the UK, where e-scooters have not been street legal, has begun [trials of rental e-scooters](#).

It is still too early to predict the long-term impacts of COVID-19 on transport. What the data show is that driving has recovered and is even exceeding pre-pandemic levels. Current trends suggest active mobility—cycling, scooters and walking—may gain mode share. Whether public transport can recover is questionable, unless a vaccine becomes available.
