

Artificial intelligence is a totalitarian's dream – here's how to take power back

August 13 2020, by Simon McCarthy-Jones

Individualistic western societies are built on the idea that no one knows our thoughts, desires or joys better than we do. And so we put ourselves, rather than the government, in charge of our lives. We tend to agree with the philosopher Immanuel Kant's claim that no one has the right to force their idea of the good life on us.

Artificial intelligence (AI) will change this. It will know us better than

we know ourselves. A government armed with AI could claim to know what its people truly want and what will really make them happy. At best it will use this to justify paternalism, at worst, totalitarianism.

Every hell starts with a promise of heaven. AI-led totalitarianism will be no different. Freedom will become obedience to the state. Only the irrational, spiteful or subversive could wish to chose their own path.

To prevent such a dystopia, we must not allow others to know more about ourselves than we do. We cannot allow a self-knowledge gap.

The All-Seeing AI

In 2019, the billionaire investor Peter Thiel claimed that AI was "<u>literally communist</u>". He pointed out that AI allows a centralizing power to monitor citizens and know more about them than they know about themselves. China, Thiel noted, <u>has eagerly embraced AI</u>.

We already know AI's potential to support totalitarianism by providing an Orwellian system of surveillance and control. But AI also gives totalitarians a philosophical weapon. As long as we knew ourselves better than the government did, liberalism could keep aspiring totalitarians at bay.

But AI has changed the game. Big tech companies collect vast amounts of data on our behavior. Machine-learning algorithms use this data to calculate not just what we will do, but who we are.

Today, <u>AI can predict</u> what films we will like, what news we will want to read, and who we will want to friend on Facebook. It can predict whether couples will stay together and if we will <u>attempt suicide</u>. From our Facebook likes, <u>AI can predict</u> our religious and <u>political views</u>, personality, intelligence, <u>drug use</u> and happiness.

The accuracy of AI's predictions will only improve. In the not-too-distant future, as the writer <u>Yuval Noah Harari</u> has suggested, AI may tell us who we are before we ourselves know.

These developments have seismic political implications. If governments can know us better than we can, a new justification opens up for intervening in our lives. They will tyrannize us in the name of our own good.

Freedom through tyranny

The philosopher Isaiah Berlin foresaw this in 1958. He <u>identified two</u> <u>types of freedom</u>. One type, he warned, would lead to tyranny.

Negative freedom is "freedom from." It is freedom from the interference of other people or government in your affairs. Negative freedom is no one else being able to restrain you, as long as you aren't violating anyone else's rights.

In contrast, positive freedom is "freedom to." It is the freedom to be master of yourself, freedom to fulfill your true desires, <u>freedom</u> to live a rational life. Who wouldn't want this?

But what if someone else says you aren't acting in your "true interest," although they know how you could. If you won't listen, they may <u>force</u> <u>you to be free</u> – coercing you for your "own good." This is one of the most dangerous ideas ever conceived. It killed tens of millions of people in <u>Stalin's Soviet Union</u> and <u>Mao's China</u>.

The Russian Communist leader, Lenin, is reported to have said that the capitalists would sell him the rope he would hang them with. Peter Thiel has argued that, in AI, capitalist tech firms of Silicon Valley have sold communism a tool that threatens to undermine democratic capitalist

society. AI is Lenin's rope.

Fighting for ourselves

We can only prevent such a dystopia if no one is allowed to know us better than we know ourselves. We must never sentimentalize anyone who seeks such power over us as well-intentioned. Historically, this has only ever ended in calamity.

One way to prevent a self-knowledge gap is to raise our privacy shields. Thiel, who labeled AI as communistic, has argued that "crypto is libertarian." Cryptocurrencies can be "privacy-enabling." Privacy reduces the ability of others to know us and then use this knowledge to manipulate us for their own profit.

Yet knowing ourselves better through AI offers powerful benefits. We may be able to use it to better understand what will make us happy, healthy and wealthy. It may help <u>guide our career choices</u>. More generally, AI <u>promises to create the economic growth</u> that <u>keeps us from each other's throats</u>.

The problem is not AI improving our self-knowledge. The problem is a power disparity in what is known about us. Knowledge about us exclusively in someone else's hands is power over us. But knowledge about us in our own hands is power for us.

Anyone who <u>processes our data</u> to create knowledge about us should be legally obliged to give us back that knowledge. We need to update the idea of "<u>nothing about us without us</u>" for the AI-age.

What AI tells us about ourselves is for us to consider using, not for others to profit from abusing. There should only ever be one hand on the tiller of our soul. And it should be ours.
