Experts from the International Atomic Energy Agency asked Japan on

Tuesday for full and detailed information about a plan to release treated but still radioactive water from the wrecked Fukushima nuclear plant into the ocean.

The three-member team, which is assisting Japan with the planned release, met Tuesday with [government officials](#) to discuss technical details before traveling to the Fukushima Daiichi plant for an on-site examination Wednesday. They will meet with Japanese experts through Friday.

Lydie Evrard, head of the IAEA's Department of Nuclear Safety and Security, said transparency and a full disclosure about the [water](#) and its treatment is key to ensuring safety for the project, which is expected to take decades.

The government and the plant's operator, Tokyo Electric Power Company Holdings, announced plans in April to start releasing the water in the spring of 2023 so hundreds of storage tanks at the plant can be removed to make room for other facilities needed for its decommissioning.

The idea has been fiercely opposed by fishermen, [local residents](#) and Japan's neighbors, including China and South Korea.

TEPCO plans to send the water through an undersea tunnel and discharge it from a location about 1 kilometer (0.6 mile) away from the coastal power plant after further treating and diluting it with large amounts of seawater to bring it below releasable limits.

Evrard said her team wants to monitor the release to make sure it meets IAEA radiation and environmental safety standards, and proposed a discussion of monitoring methods and other details.

Government and TEPCO officials say tritium, which is not harmful in small amounts, cannot be removed from the water, but all other isotopes selected for treatment can be reduced to safe levels. Controlled release of tritium from normal nuclear [plants](#) is a routine global practice, officials say.

IAEA and Japanese officials on Tuesday discussed tritium monitoring methods.

Japan has requested IAEA's assistance to ensure the discharge meets safety standards and to gain the understanding of the international community.

Trade and industry minister Hiroshi Kajiyama told reporters Tuesday that IAEA's involvement will help build trust in the Japanese effort. He said Japan will fully cooperate.

A massive earthquake and tsunami in 2011 severely damaged three reactors at the Fukushima Daiichi plant, causing contaminated cooling water to leak. The water has been stored in about 1,000 tanks which the plant's operator says will reach their capacity late next year.

Japanese officials say disposal of the water is required for the decommissioning of the plant, and that its release into the ocean is the most realistic option.
