

Russia fines Facebook and Twitter over banned content

September 14 2021, by Anastasia Clark

An illustration picture taken through a magnifying glass on March 28, 2018 in Moscow shows the icon for the social networking app Facebook on a smart phone screen. Facebook said on March 28, 2018 it would overhaul its privacy settings tools to put users "more in control" of their information on the social media website. The updates include improving ease of access to Facebook's user settings, a privacy shortcuts menu and tools to search for, download and delete personal data stored by Facebook.

Russia fined Facebook and Twitter on Tuesday for not deleting banned content, adding to a slew of penalties the government has imposed on foreign tech giants.

Russia has recently been tightening controls over US-based [tech companies](#) and last week accused them of interfering in parliamentary polls this weekend.

A court in Moscow slapped Facebook with five fines on Tuesday totalling 21 million rubles (\$288,000), according to an official Telegram channel. The same court fined Twitter five million rubles.

Russia regularly takes [legal action](#) against internet platforms for not removing content it labels illegal, such as pornographic material or posts condoning drugs and suicide.

Facebook has so far been fined 90 million rubles in Russia and Twitter 45 million, the state-run TASS news agency reported.

Judicial authorities have also fined Google citing the same offences and also for failing to store the data of Russian users on domestic services.

As part of broad efforts to reel foreign tech under its control, Russia also banned six major VPN providers this month including Nord VPN and Express VPN.

In January, Russia demanded that social networks take down posts calling on Russians to join protests in support of Kremlin critic Alexei Navalny, under the guise of preventing minors from attending.

President Vladimir Putin complained that month of the growing

influence of large technology companies, which he said were competing with sovereign states.

Election 'interference'

Russia's foreign ministry said last week it had summoned the US ambassador in Moscow to present proof of US tech giants' "interference" in the forthcoming polls.

Nearly all Kremlin critics—including allies of Navalny—have been barred from running in [parliamentary elections](#) on 17-19 September.

Russian media regulator Roskomnadzor has blocked dozens of websites linked to Navalny, including a site that instructs Russians on how to vote out politicians of the ruling United Russia party.

The regulator has also urged Google and Apple to remove an app dedicated to Navalny's "Smart Voting" campaign from their stores.

Navalny, 45, who is behind bars on old fraud charges, has this year seen his political network and anti-corruption group banned. His top aides have fled the country.

A Russian diplomatic source said Navalny's app was "obviously" linked to US secret services through its developer Roman Rubanov, the former head of Navalny's Anti-Corruption Foundation (FBK).

The source said Rubanov is now employed by the California-based space infrastructure company Momentus Inc, which has former Pentagon officials among its leadership.

The "Smart Voting" tactic led the increasingly unpopular United Russia party to lose a number of seats in local elections in 2019.

However, there is little doubt that Putin's party will retain its majority in parliament.
