

# More clean energy means more mines, but we shouldn't sacrifice communities in the name of climate action

As the world shifts to renewable energy and fossil fuel industries close down, what will happen to the local workforce, communities and

businesses that depend on them?

This week, at the global climate summit in Glasgow, business, government, and civil society leaders [discussed](#) how a "just transition" can help address the [social challenges](#) ahead. The term "just transition" is about prioritizing decent work and quality jobs for displaced workers as [coal mines](#), oil refineries, power plants and more, are rapidly phased out.

But, as we explain in our [recent research](#) paper, the idea of a just transition needs to expand. Many new mines will be required to meet demand for minerals used in clean [energy](#) infrastructure. And these mines may come with [enormous impacts](#), including new forms of inequality, [social exclusion](#), and impacts on land and natural resources.

If we fail to balance the social impacts of climate change with responsible climate action, we risk substituting one kind of harm for another—and this would be a disaster of another kind.

## **Justice in the energy transition**

The world will need vast amounts of [minerals and metals](#) for clean technology, including iron ore for wind and solar power infrastructure, copper for electrification systems, and nickel for battery storage.

The mines for these energy transition minerals are likely to be deeper, lower grade, more energy and water-intensive, and built on Indigenous peoples' lands. They will produce more mine waste and more hazardous [tailings](#) (mining residue).

Installing new [renewable energy](#) projects, such as solar and wind farms, will also cause social and environmental impacts. These projects need large areas of land, which can limit the rights of Indigenous peoples.

The International Energy Agency predicts the combined revenues from critical minerals will [overtake fossil fuels](#) before 2040. Given this soaring demand, governments will be under pressure to attract [investment](#), and approve new mines.

This will seriously test community consultation and processes for obtaining [free, prior and informed consent](#) from Indigenous peoples.

Big new mines also carry the potential to leave costly [mining legacies](#). The historical problem of environmental clean-up and abandoned mines is an issue worldwide, as mined rocks can seep acid and heavy metals into waterways for decades. Building more mines would add to this problem.

We've already seen big impacts from mining energy transition minerals in, for example, Australia. At McArthur River, Traditional Owners continue to [oppose](#) the environmental and social impacts of lead and zinc mining to the nearby township of Borroloola, including the leaking of potentially [harmful contaminants](#) and [smoldering waste rock](#).

Some countries are scrambling to secure the materials they need to transition their energy systems. China for instance has a [monopoly](#) on the production of [rare-earth elements](#), such as neodymium, which are essential for renewable technologies like wind turbines and electric vehicles.

The uncertainty in the supply of these minerals could trigger new [geopolitical conflicts](#), putting the era of open competition on global commodities markets under pressure. This could reduce transparency, and further increase [human rights](#) risks in supply chains.

A just transition must work to avoid these kind of [sacrifice zones](#) in remote mining communities and along global supply chains in the name

of climate action.

### **Expanding the idea is gaining traction**

A just transition was first proposed by the [trade union movement](#) in the 1970s. It was also mentioned in the preamble to the [Paris Agreement](#) and reaffirmed in the 2018 [Silesia Declaration](#).

The roundtable at Glasgow this week was a milestone, as it put the full scope of a just transition on the COP agenda. In opening the roundtable,

former Irish president and climate justice campaigner [Mary Robinson](#) said the energy transition should uphold human rights, gender equality and the rights of workers everywhere.

Likewise, [Sharan Burrow](#), General Secretary of the International Trade Union Confederation, [said](#) climate action should enable workers and communities to thrive with new jobs in a socially inclusive [green economy](#). This underpins calls for a [Green New Deal](#) across the world.

Fear is a great resistor but with jobs and [#JustTransition](#) we can all be prisoners of hope (h/t) Mary Robinson. Let's have climate friendly jobs plans with social dialog. [@ihrb](#) [@Jomo1966](#) [#COP26](#) [pic.twitter.com/Atx6F2B1Pr](https://pic.twitter.com/Atx6F2B1Pr)

— Sharan Burrow (@SharanBurrow) [November 2, 2021](#)

And the [Institute for Human Rights and Business](#), which convened the roundtable this week, [plans to host](#) a just transition event at every future COP.

## **So what do we need to do?**

It's taken decades to get the social impacts of climate change on the global agenda. Now, we must put [greater focus](#) on the social impacts of climate action.

The [UN Guiding Principles on Business and Human Rights](#) is an important place to start. This is an essential instrument to help all companies—mining, renewable technology and finance—take responsibility for their social and environmental impacts.

The principles require businesses to conduct [human rights due diligence](#) to avoid harming workers, local communities and people further down

the renewables supply chain. This requires companies to understand where they may infringe on the rights of others, and act on these findings.

This is similar to the idea of [climatising human rights](#), where powerful parties are held legally accountable for their climate impacts and actions.

The European Union is considering [mandatory](#) human rights due diligence laws, compelling businesses to assess the social and human rights impacts of climate action whether they're extracting minerals or building renewable energy projects. This would be an important step towards climatising human rights.

These initiatives provide a platform for change. What's missing is real action to carry them forward and achieve justice across all aspects of the energy transition.

That's why tracking progress will be vital. The World Benchmarking Alliance has launched a just transitions [assessment tool](#), and its findings were damning. It showed high-emitting companies are not using their influence to protect people, manage social impacts and [advocate](#) for a just transition.

This needs to change, urgently, as increased rates of extraction under the stress of [climate](#) change will create [new patterns](#) of harm.
