Automation and computer-aided designs are seeding the future of home gardens. With the onset of designer gardens as a service and rose-

pruning robots, weekends spent toiling in the garden will be more productive and personalized.

Gardening is proven to be healthful and joyful, but as more of us discover the joys of working in the garden for the first time, some [basic knowledge](#) about plants, landscaping and soil is required to get started. What, where and when should you plant, for instance?

These were some of the core questions co-founder Florent De Salaberry, of the start-up [Draw Me A Garden \(DMAG\)](#), realized were standing in the way of more people digging in to the subject.

IKEA-like

"Many people want to garden, but lots of us just don't have the expertise or confidence to begin," said the French tech entrepreneur.

DMAG is [an app and website](#) service which offers tailored 3D plans for garden design. It helps budding gardeners to transform any plot into a beautiful, sustainable garden with ease.

The inspiration behind the company's name comes from the children's book "Le Petit Prince" in which the prince requests the narrator to "draw me a sheep" to start a conversation and build a relationship.

De Salaberry says "Draw Me A Garden" uses [digital tools](#) in a similar way to help people build a relationship with nature in their gardens.

The DMAG service helps customers envisage their dream garden by providing [creative ideas](#), planting tips and, most important of all, delivering all the plants to their door.

Giving customers ownership of their creations is what distinguishes

DMAG from traditional landscaping, argues De Salaberry. "We know that if you just pay people to landscape your garden, not only is that really expensive but it's also hard to feel pride in it," he said.

"DMAG is about making gardening easy and affordable, and providing the resources to enable customers to be at the heart of their own projects."

Garden varieties

Customers locate their garden online via a satellite map. Next, they list any pre-existing features such as a terrace or a child's play area, then select a preferred garden style, such as for example English cottage garden or Mediterranean.

Behind the scenes, DMAG's algorithm whirrs away using these inputs together with local knowledge (soil type, elevation, sun direction) to map out the perfect garden design. Customers can visualize the design using 3D mapping tools on the DMAG website.

A qualified landscaper supports the design process and the customer receives a number of planning options to mull over.

Green thumbs

Results come back almost instantaneously. "The idea was always to enable customers to do this wherever or whenever they wanted and it takes just a few seconds to get the first design back," said De Salaberry.

Once further small refinements are made, a 3D view is rendered, and customers can sit back and wait for all plants and growing instructions to be delivered.

A typical delivery might consist of between 200 and 300 plants. These come with biodegradable cardboard scaffolds cut to the exact garden size and instructions to help the gardeners plant them out.

So far, the DMAG team have supplied to gardeners of all kinds in France, Belgium and Luxembourg, with average expenditure of around €1,500.

De Salaberry likens his turnkey garden concept to how IKEA has revolutionized kitchen design.

As they look to scale-up this work in new E.U. countries and the U.S., they hope many more people will soon be asking them to start their

gardening journey and "draw me a garden."

Glade runner

If DMAG can help gardeners create the ideal future garden space, then the TrimBot2020 might be the answer to help maintain it.

The brainchild of computer vision and robotics' expert, Professor Bob Fisher of the University of Edinburgh, TrimBot2020 is one of the first robot gardening devices that promises to do more than simply mow the lawn.

Based on a modified commercially available robot lawnmower, the autonomous vehicle prunes roses, trims hedges and shapes topiary, all while auto-navigating garden terrain.

To achieve this, the robot uses a ring of cameras to draw a 3D map of the garden, some robotic snippers and hefty dose of computer processing power.

"There are ten cameras which work together to build up a 3D model of the garden, just like our eyes do," said Fisher.

Together, these cameras help the robot gain a 360-degree view of the complex terrain of the garden. The robot also matches what it sees to a hand drawn map supplied by the users.

Upon command, the TrimBot springs into life by rolling up to the bush and scanning it to build up a computer-vision model of that particular plant.

"Once it has an idea of where all the stems are, its robotic arm comes out with the cutter and it starts snipping away," said Fisher.

Robochop

For the TrimBot team, the commercial target market is horticultural businesses responsible for maintaining parks, gardens, and recreational areas.

In such cases, they believe the robot can take on pruning duties while the human gardener does something more challenging.

While the commercial future of TrimBot is yet to be determined, the real benefits may yet come through incorporating the technology into the "brains" of next-generation of [garden](#) robots.

"Outdoor robotics is notoriously hard," said Fisher. Typical challenges include constant lighting changes, the many different shades of green and variations in the terrain.

Current robot lawnmowers usually require users to mark out an exact area to mow and to position a [robot](#) in the right place to start. TrimBot's technology should enable robots of tomorrow to work that out themselves.

"With the TrimBot project we've really demonstrated what might be possible in the future," said Fisher.
