UN Secretary General, Antonio Guterres called for a 'united, sustained, global strategy' to tackle the risks posed by AI.

UN Secretary-General Antonio Guterres called Thursday for a "united, sustained, global response" to artificial intelligence threats, as Western
allies agreed a safety framework for new cutting-edge models at a world-first summit in Britain.

The UN chief said the world was "playing catch-up" and needed to "get ahead of the wave", as he addressed the inaugural AI Safety Summit attended by various political, technology and other figures from around the world.

The two-day gathering at Bletchley Park, north of London, ended Thursday with Western governments and companies involved in so-called next generation "frontier" AI agreeing a new safety testing regime.

Governments from G7 and EU countries, as well as Australia, Korea, Singapore, struck a deal with AI-leading companies such as OpenAI, Anthropic, Google DeepMind and Microsoft, to test their latest models before and after release.

It comes amid growing concerns around the emerging tech, ranging from job losses and cyberattacks to humans' ability to remain in control of future systems.

Guterres told the summit that AI had "possible long-term negative consequences" on everything from jobs to culture, while its concentration in a few countries and companies "could increase geopolitical tensions".

Warning it might "exacerbate the enormous inequalities that already plague our world", he demanded a "united, sustained, global strategy, based on multilateralism and the participation of all stakeholders".

Hailing the new "landmark" agreement around testing, British Prime Minister Rishi Sunak said he believed it would help "tip the balance in
UK Prime Minister Rishi Sunak believes the technology will transform lives for generation to come.

'Collaboration'

Sunak, who struck an alarmist tone in a recent speech warning of AI's potential dangers, also announced that renowned AI academic Yoshua Bengio would lead a team producing an inaugural report into AI safety.

"The late Stephen Hawking once said, AI is likely to be the best or worst thing to happen to humanity," Sunak told a news conference concluding
"If we can sustain the collaboration that we have fostered over these last two days, I profoundly believe that we can make it the best."

The gathering kicked off Wednesday with an agreement signed by 28 countries and the European Union acknowledging the "need for international action".

Thursday saw senior representatives from leading Western nations formally convene, with Sunak, US Vice President Kamala Harris and EU chief Ursula von Leyen in attendance.

Who is building AI?

Who is building AI?
Leading tech figures were also present—including SpaceX and Tesla CEO Elon Musk, who turned up on both days—alongside those from academia and civil society.

China, which attended Wednesday, was not invited to the more sensitive discussions on the largely behind-closed-doors second-day sessions.

The gathering agreed to further AI safety summits in South Korea and France over the coming year.

The release of ChatGPT and other generative AI systems, which are capable of quickly producing text, images and audio from simple commands in everyday language, has captivated the public and offered a glimpse into the technology's potential.

The summit coincided with the release of a "new" Beatles song produced with AI's assistance more than four decades after it was originally recorded as a demo.
SpaceX, X and Tesla CEO Elon Musk attended the conference.

'Existential'

London and Washington this week both announced the establishment of institutes that will carry out that work and identify and mitigate other risks posed by AI.

Harris told delegates of US efforts to help distinguish authentic government-produced digital content from AI-generated content, and to prevent the use of discriminatory AI algorithms, her office said.

UK Foreign Secretary James Cleverly told AFP earlier that countries
were responding to the urgent need for a coordinated response.

"We have to move at a pace that matches the pace of technology change, we don't have a choice," he said.

"And actually what we're seeing is a willing(ness) globally, at both government level and within the commercial world, to move very, very quickly."

Musk described the summit as "timely", acknowledging AI is "one of the existential risks that we face".

US Vice President Kamala Harris urged collaboration as AI develops.
"It is potentially the most pressing one if you look at the timescale and rate of advancement," he said.

G7 powers agreed Monday on a non-binding "code of conduct" for companies developing the most advanced AI systems, while US President Joe Biden also issued an executive order regulating them domestically.

In Rome, ministers from Italy, Germany and France called for an "innovation-friendly approach" to regulating AI in Europe, as they urged more investment to challenge the United States and China.
