

Co-performing music through voice and gestures: New app enables interactive music performances

November 8 2023, by Oleg Sherbakov

Music performance requires musical expertise and instrument training. While for many it's a daunting task, others lack physical abilities to play the instruments. Ilya Borovik, a Ph.D. student in computational and data science and engineering, with his co-author from Germany set an ambitious goal to make music performances more accessible to people regardless of their background.

To bring pleasure from the familiar compositions, the authors introduced an app that allows tailoring [music](#) to one's own taste through voice, [facial expressions](#), or gestures—for example, to play it slower or as if it was a lullaby. The results are reported in a [chapter](#) in the eBook "Augmenting Human Intellect."

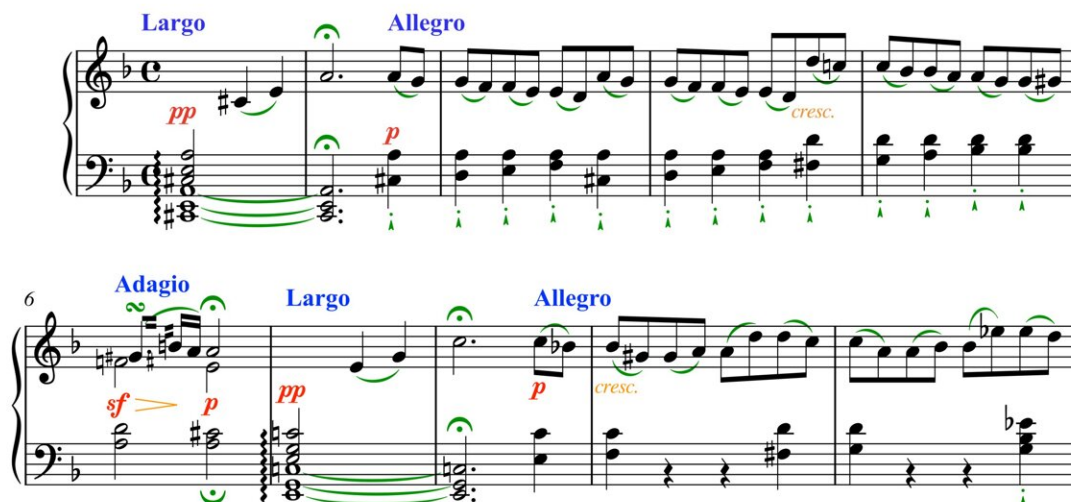

"The demo version of our system comprises an AI model, which has been trained using an open corpus of 1,067 renderings provided for 236 compositions of piano music. The model takes notated music as input and learns how to play it while predicting performance characteristics: local tempo, position, duration, and note loudness. The output is a rendering of the composition. We aimed to provide control over the model to the user, so we incorporated it into the app, which enables interaction between the model and the end user," says Ilya Borovik.

When launching the app, a user gives access to the camera and microphone of the smartphone and starts listening to a randomly generated rendering for a [composition](#) from the database. To change the rendering, the user starts a video or audio recording. With voice or facial expressions, the model can be asked to perform the music in some other way. For example, Chopin's Mazurkas can be turned into a lullaby.

Sonate No. 17, "Tempest"

1st Movement
Opus 31 No. 2

Ludwig van Beethoven
(1770 - 1827)

Directions for excerpt from Piano Sonata No. 17 by Beethoven. Blue directions stand for tempo, red and orange for loudness, green for note accents. Credit: Ilya Borovik/ Skoltech

"For interacting with the model, we use performance directions that have already been put in the notes. The musical scores have written markings that guide the player on how to play music: faster, slower, louder, etc. Based on all available data, the voice commands of the user are turned into these performance directions," adds Ilya.

The project is still in progress. The research team is planning to make the user-model communication more interactive, so that the user could get the desired results in just a couple of iterations. The app's interface will be improved, while the database of compositions will be expanded. As of now, it contains [classical music](#), which is the world's music heritage. At the next stage, the researchers will include orchestral music.
