

Montreal research hub spearheads global AI ethics debate

December 2 2023, by Rafael MIRO, Mathiew LEISER

Yoshua Bengio, dubbed a 'godfather of AI,' is the founder of the Mila institute in Montreal.

Rapid developments in artificial intelligence—and recent turmoil at industry powerhouse OpenAI—have brought fresh attention to a key hub

of ethics research related to the technology in Montreal, led by Canadian "godfather of AI" Yoshua Bengio.

Bengio—who in 2018 shared with Geoffrey Hinton and Yann LeCun the Turing Award for their work on [deep learning](#)—says he is worried about the technology leapfrogging [human intelligence](#) and capabilities in the not-too-distant future.

Speaking to AFP at his home in Montreal, the professor warned that AI developments are moving at breakneck speed and risked "creating a new species capable of making decisions that harm or even endanger humans."

OpenAI's recent dismissal and then rehiring a few days later of chief executive Sam Altman—who has been accused of downplaying risks in his push to advance its ChatGPT bot—illustrates some of the turmoil in the startup sector and fierce competition in the race to commercialize generative AI.

For some time, Bengio has been warning about companies moving too fast without guardrails, "potentially at the public's expense."

It is essential, he said, to have "rules that'll be followed by all companies."

At a world-first AI summit in Britain in early November, Bengio was tasked with leading a team producing an inaugural report on AI safety.

The aim is to set priorities to inform future work on the security of the cutting-edge technology.

Neighbors to the Mila institute include AI research facilities of American tech giants Microsoft, Meta, IBM and Google.

Society and AI

The renowned AI academic has brought together a "critical mass of AI researchers" (1,000+) through his Mila research institute, located in a former working-class neighborhood of Montreal.

His neighbors include AI research facilities of American tech giants Microsoft, Meta, IBM and Google.

"This concentration of experts in [artificial intelligence](#), which is greater than anywhere else in the world," is what attracted Google, says Hugo

Larochelle, the hoodie-wearing scientific director of the Silicon Valley giant's AI subsidiary Deepmind.

Early on, these researchers began thinking about the future of AI, and consultations with the public and researchers from all disciplines led in 2018 to a global AI charter called the Montreal Declaration for a Responsible Development of Artificial Intelligence.

Mila is a not-for-profit organization led by Yoshua Bengio who has brought together some of the world's top minds in deep learning.

"We knew early on that the [scientific community](#) needed to think about the integration of AI into society," explained Guillaume Macaux, vice-

president of OBVIA, an international observatory studying the social impacts of AI.

Its 220 researchers advise [government policies](#) and raise public awareness of the possible positive effects and negative impacts of this cutting-edge technology.

Art 'demystifying AI'

Artists too are playing a part in "demystifying AI," says Sandra Rodriguez, who splits her time making art in Montreal and teaching digital media at the prestigious Massachusetts Institute of Technology (MIT) in the United States.

She showed off to AFP her latest art installation.

Entering a breathtaking futuristic world via a [virtual reality](#) (VR) headset, the public is able to converse with a bot inspired by American linguist Noam Chomsky.

Arist Sandra Rodriguez describes Montreal as a 'fantastic playground' for exploring AI and 'debating (related) ethical and societal issues'

Rodriguez splits her time making art in Montreal and teaching digital media at the Massachusetts Institute of Technology.

Voice and text answers to queries appear simultaneously. With the touch of a finger, lists of alternative responses considered by the AI with their associated percentage gradient pop up.

"You quickly realize that it's actually just an algorithm," said Rodriguez.

"Montreal is a fantastic playground" for exploring the potential and limits of artificial intelligence, as well as "debating (related) ethical and societal issues," she told AFP.

According to Rodriguez, art becomes "necessary more than ever" to

invite "a wider public to ask questions about the issues of artificial [intelligence](#) which will affect them tomorrow."
