

AI startups swap independence for Big Tech's deep pockets

July 28 2024, by Alex PIGMAN

Big tech companies are increasingly in the spotlight for their appetite to eat up smaller firms, prompting some concerns in Silicon Valley.

It's the case of the vanishing startup: some of Silicon Valley's most promising names in the fast-developing generative AI space are being

gobbled up by or tied to the hip of US tech giants.

Short on funds, in the past few months promising companies like Inflection AI or Adept have seen founders and key executives quietly exit the stage to join the world's dominant tech companies through discrete transactions.

Critics believe these deals are acquisitions in all but name and have been especially designed by Microsoft or Amazon to avoid the attention of competition regulators, which the companies strenuously deny.

Meanwhile, firms like Character AI are reported to be struggling to raise the cash needed to remain independent, and some, like French startup Mistral, are thought to be especially vulnerable to being bought out by a tech giant.

Even ChatGPT's creator OpenAI is locked in a relationship with Microsoft, the world's biggest [company](#) by market capitalization.

Microsoft helps guarantee OpenAI's future with \$13 billion in investment in return for exclusive access to the startup's industry-leading models.

Amazon has its own deal with Anthropic, which makes its own high-performing models.

'Big money'

Joining the revolution brought by the era-defining release of ChatGPT requires a supply of cash that only tech behemoths like Microsoft, Amazon or Google can afford.

"The ones with the big money define the rules and design the outcomes

that play in their favor," said Sriram Sundararajan, a tech investor and adjunct faculty member at the Leavey School of Business at Santa Clara University.

Breaking from typical Silicon Valley legend, generative AI won't be developed out of some founder's garage.

That type of artificial intelligence, which creates human-like content in just seconds, is a special breed of technology that requires colossal levels of computing from specialized servers.

"Startups have been founded by former research leaders at big tech companies, and they require the resources that only large cloud providers can make available," said Brendan Burke, AI analyst at Pitchbook, which tracks the venture capital world.

"They're not following the traditional entrepreneurial journey of doing more with less, they're really looking to recreate the conditions that they experienced working in a highly funded research lab."

Many of these founders, including those at Inflection or Adept, came from Google or OpenAI.

Mustafa Suleyman, the former boss of Inflection, was a leader at Google DeepMind—and has now left his startup, with key employees in tow, to head up the consumer AI division at Microsoft.

Inflection still exists on paper but has been stripped of the very assets that gave it value.

Lining up with the big tech companies "makes a lot of sense," said Abdullah Snobar, [executive director](#) at DMZ, a startup incubator in Toronto. Their deep pockets help keep "the wheels greased and things

moving forward."

'Sucking up all the juice'

But aligning with established tech behemoths also risks "killing competition," potentially creating a situation where "these three big tech companies (are) sucking up all the juice" of creativity and innovation, he added.

The burning question in Silicon Valley is whether government regulators will do anything about it.

Big tech companies are increasingly in the spotlight for their appetite to eat up smaller firms.

Israeli cybersecurity company Wiz this week scrapped plans to sell to Google in what would have been the giant's biggest deal ever—reportedly because the buyout would not have survived competition regulators.

For Inflection, [antitrust regulators](#) in the United States, European Union and Britain said they would look closely at its ties with Microsoft. Amazon's deal with Adept has raised questions with the Federal Trade Commission in Washington.

John Lopatka, professor of law at Penn State University, said "antitrust enforcers would have a difficult time blocking the arrangements" with Inflection and Adept.

However, that "does not mean they won't try."

US, European and UK regulators on Tuesday signed a joint statement insisting that they won't let big tech companies run roughshod over the

nascent AI industry.

It's a sign that "regulation is catching up to AI," warned Sundararajan.
