Could hotel service robots help the hospitality industry after COVID-19?

6 May 2020

Dr. Tracy Xu, lecturer in hospitality at the University of Surrey's School of Hospitality and Tourism Management, has published a paper in the International Journal of Contemporary Hospitality Management derived from interviews with 19 hotel HR experts to identify the key trends and major challenges that will emerge in the next 10 years and how leaders should deal with the challenges brought about by service robot technologies.

Results showed that while service robots are anticipated to increase efficiency and productivity of hotel activities, they may also pose challenges such as high costs, skill deficits and significant changes to the organizational structure and culture of hotels. Therefore, the anticipated applications and integration of robotic technology will require leaders of the future to carefully consider the balance between the roles of service robots and human employees in the guest experience and to nurture a work environment that embraces open-mindedness and change.

The project finished in March 2020 just as COVID-19 broke out and as the virus rendered non-essential travel impossible, most hotels around the globe are feeling a catastrophic economic impact. There is now even more interest in developing innovative ways of deploying service robots across all economic sectors to limit human interaction. Considering the current pandemic, many industries are having to reinvent processes and systems to cope with a new isolated way of life. Robotic interaction in hotels could facilitate more socially distanced models of operation to enable a safer and faster reopening and recovery of some hotels.

Dr. Xu said: "Application of service robots in the hotel industry is on the rise. With the added factor of a need to reassure potential guests that their stays will be compatible with minimised social contact and human interaction, this process could be accelerated. During the lockdown period it is likely that hotel managers will be planning for a 'fresh start' in the recovery and rebuilding period after the social isolation restrictions have been lifted and this is predicted to have a positive stimulus on the adoption of service robots.

"The anticipated applications and integration of robotic technology will require leaders of the future to carefully consider the balance between the roles of service robots and human employees in the guest experience and to nurture a work environment that embraces open-mindedness and change."

Dr. Xu was joined in her research by fellow Surrey colleague Mark Ashton, teaching fellow, and Jason Stienmetz, assistant professor at MODUL University Vienna.

Mr Ashton said: "This is the first type of study to examine hospitality leadership and human resource management in the context of robotized hotels and at a time where hotels seem to need it most. Forward-thinking businesses who are proactively prepared for the introduction of these exciting new
technologies will benefit in the long term."
